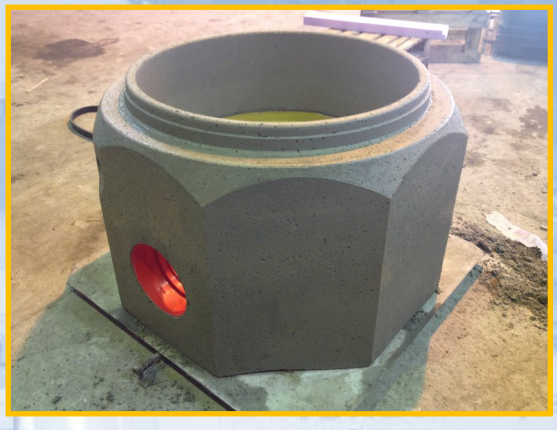
Lined Manholes & Pre-Channeled Bases

Teksam has a full program for the precaster producing manhole components. Teksam production stations can produce all elements of a manhole system: base sections, risers, concentric cones, eccentric cones, and flattops.

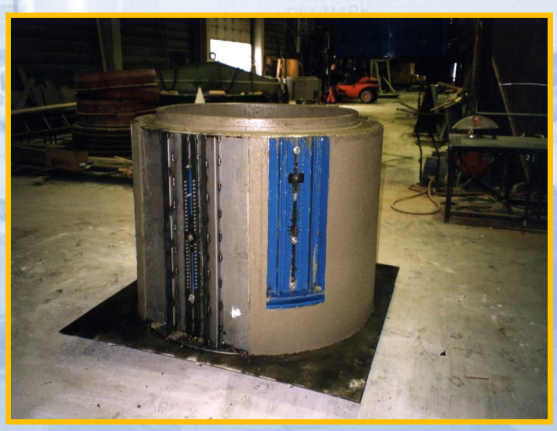
For the precaster needing to produce lined elements, Teksam can accommodate any of the common lining systems on the market such as Predl, Agru, T-Lock, and others. Once the liner has been formed or fabricated to the size of the manhole, the liners will slip around the core, and once the concrete is introduced and consolidated, the liner is anchored forever in the manhole section.

Teksam – your lined manhole specialist!

Lined Manholes & Pre-Channeled Bases



In the case where preformed inverts are required special steel invert sections can be produced to mate with the core to produce a preformed invert in the base section during the production cycle. These sections can also be built to accommodate liners preformed to fit the special invert sections.



Teksam also has a system that allows the producer to form hole openings in any location around the circumference and at any height. This system is based on steel panels attached to the outer jacket. These panels are fitted with hole formers for different sizes, placed at any height and location around the perimeter. Once the manhole base has been produced, the hole forming system on the inside of the jacket is released so the product can be stripped.
